

**Vibration System**  
Feel like flying

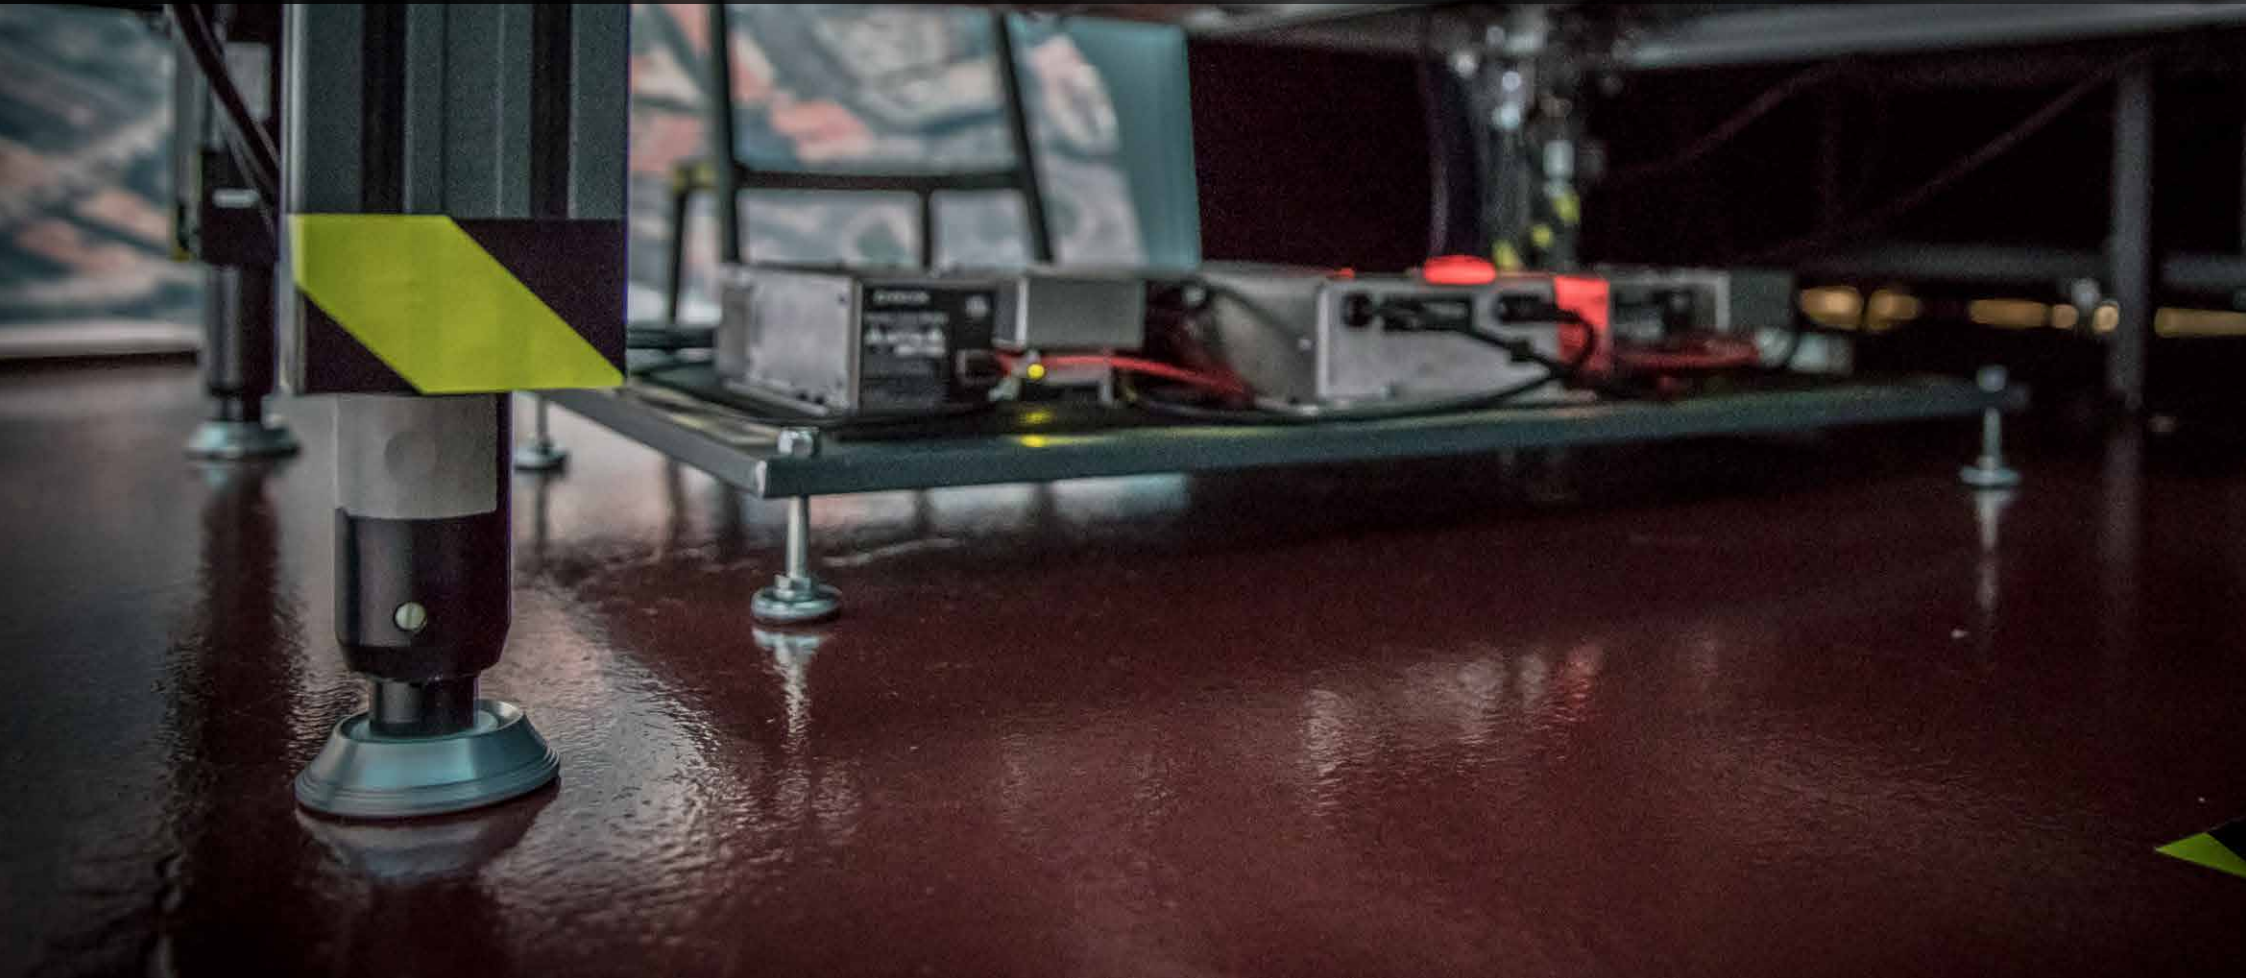

entrol

## Gives pilots representative cues of each aircraft

- The vibration system provides an authentic flying environment and stimulates pilots with representative aircraft vibrations.
- It consists of 4 electromagnetic actuators located below the cockpit. The system attains a consistent vibration of the whole cockpit, not restricted to the seats.
- By generating a wide bandwidth of frequencies and amplitudes, it replicates normal and abnormal flying conditions such as:
  - Vortex ring
  - Starting engines
  - Overspeed
  - Translational lift
  - Excessive pitch and roll
  - Hovering
  - Turbulence
  - Ground contact
  - Mechanical malfunction

## Test the vibration system in our showroom

- You can try the vibration system in our showroom at your best convenience.
